

## Geometry Through Art

Visualizing hidden shapes is fun.  
How many of the shapes shown here can you find? There are many of each, and in different sizes.

You can also find symmetrical (kaleidoscopic) patterns using assorted geometric shapes! The secret is to locate the hidden 'units of repeat'.

There are 6 of them. The diameters when highlighted with color markers will help you to see them more clearly. (Use a straight edge.) Look for the 6 sectors! (3 diameters!)

This symmetrical pattern rotates around a 'point of symmetry' (which is the center of the circle!)
